Abstract. Replace with a 150–250 word abstract stating the problem, method, principal results and contribution. Do not report expected findings as completed results. Avoid citations in the abstract.

Keywords: Keyword one; keyword two; keyword three; keyword four

1 Introduction

Define the industrial engineering or advanced manufacturing problem, its practical importance and the research gap. State the research question and identify the contribution. Explain how this work differs from prior methods. Cite sources in order of first appearance, for example [1].

2 Related Work

Compare competing approaches, assumptions, evidence and limitations. Explain the gap addressed by this study rather than listing literature summaries.

3 Methodology

Describe the model, experimental design, data sources and analysis so the work can be reproduced. Define variables, units, assumptions, baselines and evaluation metrics. Explain ethics approvals and data permissions where applicable.

$$\min Z = \sum_{i=1}^n c_i x_i. \quad (1)$$

Define each symbol and use SI units.

4 Results and Discussion

Report actual evidence supporting each claim. Compare suitable baselines, quantify uncertainty and discuss sensitivity. Relate technical performance to industrial consequences. Separate observations from interpretation. Figures must be legible at final size. Place figure captions below figures and table captions above tables.

Table 1: Example structure. Replace with actual study data.

Method	Metric and unit	Result
Baseline	Specify metric	Measured result
Proposed method	Same metric	Measured result

5 Conclusions

Answer the research question, summarize the contribution and identify limitations and future work. Avoid new claims that were not supported by the results.

Acknowledgments and Declarations

Identify funding, contributions, conflicts of interest, ethics approval, data availability and relevant AI-assisted tool use. Include only applicable statements.
